

For This Lab there are 2 different tutorials you will be performing. The links to these tutorials are listed below. The main focus of these tutorials is to create and validate a form using react and node. Also, these tutorials do not need the amount of installation previous projects have used, since they use links to the react libraries. Due to this, in order for the programs you create to run correctly, you will need to have the node server running on your machine when you test your programs. For this lab you will create a main lastname_lab2 folder. Inside that folder you will create a lastnametutorial1 and lastnametutorial2 folders. You will perform the tutorials below, ensuring to comment the code that is created. When all tutorials are complete you will zip the folder and upload to D2L.
